ACTEX EXAM P STUDY MANUAL - April 2020 Edition

Errata List, by S. Broverman Updated May 22/20

May 22/20 Page 494, #18, in answers B,C,D and E, y should be λ

May 22/20 Page 501, #18 solution, e^{-y} should be $e^{-\lambda}$ in every occurrence

May 22/20 Page 512, #4 solution, final line should be Then $P(S < 4) = 1 \times 0.85 + 1 \times 0.15 + 0.88 \times 0.05 = 0.994$. Answer: D

May 22/20 Page 518, #24 solution is incorrect. The correct solution is the following.

Let X_A be the number of sales for manufacturer A, and X_B for B, and X_{CD} for manufacturers C and D combined. X_A, X_B and X_{CD} have a multinominal distribution with

$$n = 10$$
 and $p_A = 0.10$, $p_B = 0.15$, $p_{CD} = 0.75$

We wish to find the probability $P[(X_A \ge 2) \cap (X_B \ge 2)] = 1 - P[(X_A \le 1) \cup (X_B \le 1)].$

$$P[(X_A \le 1) \cup (X_B \le 1)] = P(X_A \le 1) + P(X_B \le 1) - P[(X_A \le 1) \cap (X_B \le 1)].$$

$$P(X_A \leq 1) = P(X_A = 0) + P(X_A = 1) = (.9)^{10} + 10(.9)^9(.1) = 0.7361.$$

$$P(X_B \le 1) = P(X_B = 0) + P(X_B = 1) = (.85)^{10} + 10(.85)^9(.15) = 0.5443.$$

The sales numbers that result in the event $(X_A \le 1) \cap (X_B \le 1)$ are as follows:

Sales

$$X_A$$
 0 1 0 1 X_B 0 0 1 1 X_{CD} 10 9 9 8

According to the multinomial probability function,

$$P[(X_A = x_A) \cap (X_B = x_B) \cap (X_{CD} = x_{CD})] = \frac{10!}{x_A! \times x_B! \times x_{CD}!} \times p_A^{x_A} \times p_B^{x_B} \times p_{CD}^{x_{CD}} \times p_A^{x_{CD}} \times p_B^{x_{CD}} \times p_A^{x_{CD}} \times p_B^{x_{CD}} \times$$

The probabilities of the combinations above are

$$\begin{split} P[(X_A = 0) \cap (X_B = 0) \cap (X_{CD} = 10)] \\ &= \frac{10!}{0! \times 0 \times 10!} \times (0.1)^0 \times (0.15)^0 \times (0.75)^{10} = 0.0563. \end{split}$$

In a similar way, we get $P[(X_A = 1) \cap (X_B = 0) \cap (X_{CD} = 9)] = 0.0751$,

$$P[(X_A = 0) \cap (X_B = 1) \cap (X_{CD} = 9)] = 0.1126$$
, and

$$P[(X_A = 1) \cap (X_B = 1) \cap (X_{CD} = 8)] = 0.1352.$$

Then, $P[(X_A \le 1) \cap (X_B \le 1)] = 0.0563 + 0.0751 + 0.1126 + 0.1352 = 0.3792$,

and
$$P[(X_A \le 1) \cup (X_B \le 1)] = 0.7361 + 0.5443 - 0.3792 = .9012$$
,

and the probability that no manufacturer gets dropped is 1 - 0.9012 = 0.0988. Answer: A

May 22/20 Page 520, #29 solution is incorrect.

The value of -450 on the 6th line from the bottom should be -225. This changes the bottom line of the solution to be

The total expected insurance payment is $12,500 \times .09 - 225 + 738.99 = 1,639$ Answer: E
